# **Variables and Data Types**

# Variable Assignment

>>> x=5 >>> × 5

#### Calculations With Variables

>>> x+2	Sum of two variables
7 >>> x-2	Subtraction of two variables
3 >>> x*2	Multiplication of two variables
10 >>> x**2	Exponentiation of a variable
25 >>> x%2	Remainder of a variable
1 >>> x/float(2)	Division of a variable
2 5	DIVISION OF A VALIABLE

## Types and Type Conversion

str()	'5', '3.45', 'True'	Variables to strings
int()	5, 3, 1	Variables to integers
float()	5.0, 1.0	Variables to floats
bool()	True, True, True	Variables to booleans

# **Asking For Help**

>>> help(str)

# Strings

```
>>> my string = 'thisStringIsAwesome'
>>> my string
'thisStringIsAwesome'
```

# **String Operations**

```
>>> my string * 2
 'thisStringIsAwesomethisStringIsAwesome'
>>> my string + 'Innit'
 'thisStringIsAwesomeInnit'
>>> 'm' in my string
```

#### Lists

### Also see NumPy Arrays

```
>>> a = 'is'
>>> b = 'nice'
>>> my list = ['my', 'list', a, b]
>>>  my list2 = [[4,5,6,7], [3,4,5,6]]
```

## **Selecting List Elements**

#### Index starts at o

#### Subset

>>> my list[1] >>> my list[-3] Slice >>> my list[1:3]

>>> my list[1:] >>> my list[:3] >>> my list[:]

# **Subset Lists of Lists**

>>> my list2[1][0] >>> my list2[1][:2] Select item at index 1 Select 3rd last item

Select items at index 1 and 2 Select items after index o Select items before index 3 Copy my list

my\_list[list][itemOfList]

## **List Operations**

```
>>> my list + my list
['my', 'list', 'is', 'nice', 'my', 'list', 'is', 'nice']
>>> my list * 2
['my', 'list', 'is', 'nice', 'my', 'list', 'is', 'nice']
>>> my list2 > 4
```

#### List Methods

	>>>	<pre>my_list.index(a)</pre>	Get the index of an item
ı	>>>	my list.count(a)	Count an item
ı	>>>	my list.append('!')	Append an item at a time
ı	>>>	<pre>my list.remove('!')</pre>	Remove an item
ı	>>>	del(my list[0:1])	Remove an item
	>>>	<pre>my_list.reverse()</pre>	Reverse the list
	>>>	<pre>my_list.extend('!')</pre>	Append an item
ı	>>>	<pre>my_list.pop(-1)</pre>	Remove an item
	>>>	<pre>my_list.insert(0,'!')</pre>	Insert an item
1	>>>	<pre>my_list.sort()</pre>	Sort the list

#### **String Operations**

# Index starts at o

```
>>> my string[3]
>>> my string[4:9]
```

## String Methods

>>>	my_string.upper()	String to uppercase
>>>	my_string.lower()	String to lowercase
>>>	my_string.count('w')	Count String elements
>>>	<pre>my_string.replace('e', 'i')</pre>	Replace String elements
>>>	my_string.strip()	Strip whitespaces

>>>	<pre>np.delete(my_array,[1])</pre>	Delete items in an array
>>>	np.mean(my_array)	Mean of the array
>>>	np.median(my_array)	Median of the array
>>>	<pre>my_array.corrcoef()</pre>	Correlation coefficient
>>>	np.std(my array)	Standard deviation

# **NumPy Basics**

Learn Python for Data Science Interactively at www.DataCamp.com

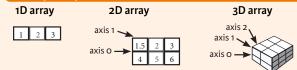

# NumPv

The NumPy library is the core library for scientific computing in Python. It provides a high-performance multidimensional array object, and tools for working with these arrays.

Use the following import convention: >>> import numpy as np

## NumPy Arrays

# **Creating Arrays**

```
>>> a = np.array([1,2,3])
>>> b = np.array([(1.5,2,3), (4,5,6)], dtype = float)
>>> c = np.array([[(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]],
                 dtype = float)
```

#### Initial Placeholders

initial i laccifolacis		
>>> np.zeros((3,4))	Create an array of zeros	
>>> np.ones((2,3,4),dtype=np.int16)		
>>> d = np.arange(10,25,5)	Create an array of evenly	
	spaced values (step value)	
>>> np.linspace(0,2,9)	Create an array of evenly	
	spaced values (number of samples)	
>>> e = np.full((2,2),7)	Create a constant array	
>>> f = np.eye(2)	Create a 2X2 identity matrix	
>>> np.random.random((2,2))	Create an array with random value	
>>> np.empty((3,2))	Create an empty array	

## 1/0

# Saving & Loading On Disk

```
>>> np.save('my array', a)
>>> np.savez('array.npz', a, b)
>>> np.load('my array.npy')
```

# Saving & Loading Text Files

>>>	np.loadtxt("myfile.txt")
>>>	np.genfromtxt("my file.csv", delimiter=',')
>>>	np.savetxt("mvarrav.txt", a, delimiter=" ")

# Data Types

-		
	>>> np.int64	Signed 64-bit integer types
	>>> np.float32	Standard double-precision floating point
	>>> np.complex	Complex numbers represented by 128 floats
	>>> np.bool	Boolean type storing TRUE and FALSE values
	>>> np.object	Python object type
	>>> np.string_	Fixed-length string type
	>>> np.unicode_	Fixed-length unicode type

## Inspecting Your Array

>>> a.shape >>> len(a)	Array dimensions Length of array
>>> b.ndim >>> e.size	Number of array dimensions Number of array elements
>>> b.dtype >>> b.dtype.name >>> b.astype(int)	Data type of array elements Name of data type Convert an array to a different type

# **Asking For Help**

>>> np.info(np.ndarray.dtype)

# **Array Mathematics**

# **Arithmetic Operations**

>>> g = a - b	Subtraction
array([[-0.5, 0. , 0. ], [-3. , -3. , -3. ]])	
>>> np.subtract(a,b)	Subtraction
>>> b + a array([[ 2.5, 4. , 6. ],	Addition
[ 5. , 7. , 9. ]])	
>>> np.add(b,a)	Addition
>>> a / b	Division
array([[ 0.66666667, 1. , 1. ], [ 0.25 , 0.4 , 0.5 ]])	
>>> np.divide(a,b)	Division
>>> a * b array([[ 1.5, 4., 9.],	Multiplication
[ 4. , 10. , 18. ]])	
>>> np.multiply(a,b)	Multiplication
>>> np.exp(b)	Exponentiation
>>> np.sqrt(b)	Square root
>>> np.sin(a)	Print sines of an array
>>> np.cos(b)	Element-wise cosine
>>> np.log(a)	Element-wise natural logarithm
>>> e.dot(f) array([[ 7., 7.],	Dot product
_	
[ 7., 7.]])	

### Comparison

>>> a == b	Element-wise comparison
array([[False, True, True],	·
[False, False, False]], dtype=boo	1)
>>> a < 2	Element-wise comparison
array([True False False] dtyme=hool)	· ·

Array-wise comparison

# >>> np.array\_equal(a, b) Aggregate Functions

>>> a.sum()	Array-wise sum
>>> a.min()	Array-wise minimum value
>>> b.max(axis=0)	Maximum value of an array row
>>> b.cumsum(axis=1)	Cumulative sum of the elements
>>> a.mean()	Mean
>>> b.median()	Median
>>> a.corrcoef()	Correlation coefficient
>>> np.std(b)	Standard deviation

# Copying Arrays

>>> h = a.view()	Create a view of the array with the same data
>>> np.copy(a)	Create a copy of the array
>>> h = a.copy()	Create a deep copy of the array

# **Sorting Arrays**

# Subsetting, Slicing, Indexing

### Subsetting >>> a[2] >>> b[1,2]

>>> b[0:2,1]

>>> c[1,...]

>>> a[a<2] array([1])

>>> a[ : :-1] array([3, 2, 1])

**Boolean Indexing** 

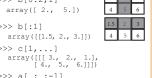

>>> b[:1]

array([ 2., 5.])

6.0 Slicing >>> a[0:2] array([1, 2])

Fancy Indexing >>> b[[1, 0, 1, 0],[0, 1, 2, 0]] array([ 4. , 2. , 6. , 1.5]) >>> b[[1, 0, 1, 0]][:,[0,1,2,0]] array([[ 4. ,5. , 6. , 4. ], [ 1.5, 2. , 3. , 1.5], [ 4. , 5. , 6. , 4. ], [ 1.5, 2. , 3. , 1.5]]

Select the element at the 2nd index

Select the element at row o column 2 (equivalent to b[1][2])

Select items at index 0 and 1

Select items at rows 0 and 1 in column 1

Select all items at row o (equivalent to b[0:1, :]) Same as [1,:,:]

Reversed array a

Select elements from a less than 2

Select elements (1,0), (0,1), (1,2) and (0,0)

Select a subset of the matrix's rows and columns

# **Array Manipulation**

#### **Transposing Array**

>>> i = np.transpose(b) >>> i.T

# **Changing Array Shape**

>>> b.ravel() >>> g.reshape(3,-2)

# Adding/Removing Elements

>>> h.resize((2,6)) >>> np.append(h,g) >>> np.insert(a, 1, 5) >>> np.delete(a,[1])

# **Combining Arrays**

array([ 1, 2, 3, 10, 15, 20]) >>> np.vstack((a,b)) array([[1., 2., 3.], [1.5, 2., 3.], [4., 5., 6.]]) >>> np.r [e,f] >>> np.hstack((e,f)) array([[ 7., 7., 1., 0.], [ 7., 7., 0., 1.]]) >>> np.column stack((a,d)) array([[ 1, 10], >>> np.c\_[a,d]

>>> np.concatenate((a,d),axis=0)

# Splitting Arrays

>>> np.hsplit(a,3) [array([1]),array([2]),array([3])] >>> np.vsplit(c,2) [array([[[ 1.5, 2., 1.], [ 4., 5., 6.]]]), array([[[ 3., 2., 3.], [ 4., 5., 6.]]])]

Permute array dimensions Permute array dimensions

Flatten the array Reshape, but don't change data

Return a new array with shape (2,6) Append items to an array Insert items in an array Delete items from an array

Concatenate arrays

Stack arrays vertically (row-wise)

Stack arrays vertically (row-wise) Stack arrays horizontally (column-wise)

Create stacked column-wise arrays

Create stacked column-wise arrays

Split the array horizontally at the 3rd

Split the array vertically at the 2nd index

# **Pandas Basics**

Learn Python for Data Science Interactively at www.DataCamp.com

### **Pandas**

The **Pandas** library is built on NumPy and provides easy-to-use data structures and data analysis tools for the Python programming language.

#### Use the following import convention:

>>> import pandas as pd

#### **Pandas Data Structures**

#### Series

A one-dimensional labeled array capable of holding any data type

```
>>> s = pd.Series([3, -5, 7, 4], index=['a', 'b', 'c', 'd'])
```

#### DataFrame

1/0

A two-dimensional labeled data structure with columns of potentially different types

```
>>> data = {'Country': ['Belgium', 'India', 'Brazil'],
           'Capital': ['Brussels', 'New Delhi', 'Brasília'],
           'Population': [11190846, 1303171035, 207847528]}
>>> df = pd.DataFrame(data,
                     columns=['Country', 'Capital', 'Population'])
```

### Asking For Help

>>> help(pd.Series.loc)

#### Selection

Also see NumPv Arravs

Select single value by row &

column

#### Gettina

>>> s[ -5	'b']			Get one element
>>> df	[1:]			Get subset of a DataFrame
Cou	ntry	Capital	Population	
1 I	ndia	New Delhi	1303171035	
2 Br	azil	Brasília	207847528	

#### Selecting, Boolean Indexing & Setting

#### **By Position**

```
>>> df.iloc([0],[0])
 'Belgium'
>>> df.iat([0],[0])
 'Belgium'
```

#### **Bv** Label

	Select single value by row & column labels
>>> df.at([0], ['Country'])	
'Belgium'	

#### By Label/Position

```
Select single row of
>>> df.ix[2]
                                          subset of rows
 Country
               Brazil
 Capital
            Brasília
 Population 207847528
                                          Select a single column of
>>> df.ix[:,'Capital']
      Brussels
                                          subset of columns
      New Delhi
       Brasília
                                          Select rows and columns
>>> df.ix[1,'Capital']
  'New Delhi'
```

Boolean Indexing	
>>> s[~(s > 1)]	Series s where value is not >1
>>> s[(s < -1)   (s > 2)]	s where value is <-1 or >2
>>> df[df['Population']>1200000000]	Use filter to adjust DataFrame
Setting	
>>> s['a'] = 6	Set index a of Series s to 6

```
>>> pd.read csv('file.csv', header=None, nrows=5)
>>> df.to csv('myDataFrame.csv')
```

#### Read and Write to Excel

Read and Write to CSV

```
>>> pd.read excel('file.xlsx')
>>> pd.to excel('dir/myDataFrame.xlsx', sheet name='Sheet1';
Read multiple sheets from the same file
```

### >>> xlsx = pd.ExcelFile('file.xls')

```
>>> df = pd.read excel(xlsx, 'Sheet1')
```

# Read and Write to SQL Query or Database Table

```
>>> from sqlalchemy import create engine
>>> engine = create engine('sglite:///:memory:')
>>> pd.read sql("SELECT * FROM my_table;", engine)
>>> pd.read sql table('my table', engine)
>>> pd.read sql query("SELECT * FROM my_table;", engine)
```

read sql() is a convenience wrapper around read sql table() and read sql query()

```
>>> pd.to sql('myDf', engine)
```

# Dropping

```
>>> s.drop(['a', 'c'])
                                   Drop values from rows (axis=0)
>>> df.drop('Country', axis=1) Drop values from columns(axis=1)
```

#### Sort & Rank

```
>>> df.sort index()
                                        Sort by labels along an axis
>>> df.sort_values(by='Country'
                                        Sort by the values along an axis
>>> df.rank()
                                        Assign ranks to entries
```

## **Retrieving Series/DataFrame Information**

#### Basic Information

>>> df.shape >>> df.index >>> df.columns >>> df.info() >>> df.count()	(rows,columns) Describe index Describe DataFrame columns Info on DataFrame Number of non-NA values
---	--

#### Summary

>>>	df.sum()	Sum of values
>>>	df.cumsum()	Cummulative sum of values
>>>	df.min()/df.max()	Minimum/maximum values
>>>	<pre>df.idxmin()/df.idxmax()</pre>	Minimum/Maximum index value
>>>	df.describe()	Summary statistics
		Mean of values
>>>	df.median()	Median of values

# **Applying Functions**

```
>>> f = lambda x: x*2
>>> df.apply(f)
                            Apply function
>>> df.applymap(f)
                            Apply function element-wise
```

# **Data Alignment**

#### Internal Data Alignment

NA values are introduced in the indices that don't overlap:

```
>>> s3 = pd.Series([7, -2, 3], index=['a', 'c', 'd'])
>>> s + s3
       10.0
 b
       NaN
 С
       5.0
```

#### **Arithmetic Operations with Fill Methods**

You can also do the internal data alignment yourself with the help of the fill methods:

```
>>> s.add(s3, fill value=0)
    10.0
 b
      -5.0
 C
     5 0
     7.0
 d
>>> s.sub(s3, fill value=2)
>>> s.div(s3, fill value=4)
>>> s.mul(s3, fill value=3)
```

# **Pandas**

Learn Python for Data Science Interactively at <a href="www.DataCamp.com">www.DataCamp.com</a>

## **Reshaping Data**

#### Pivot

>>> df3= df2.pivot(index='Date', columns='Type', values='Value') Spread rows into columns

	Date	Type	Value	
0	2016-03-01	a	11.432	
1	2016-03-02	b	13.031	
2	2016-03-01	с	20.784	
3	2016-03-03	a	99.906	
4	2016-03-02	a	1.303	
5	2016-03-03	с	20.784	

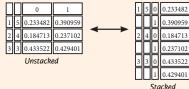

Туре	a	Ь	с
Date			
2016-03-01	11.432	NaN	20.784
2016-03-02	1.303	13.031	NaN
2016-03-03	99.906	NaN	20.784

#### Pivot Table

Spread rows into column	>> df4 = pd.pivot table(df2,
· ·	values='Value',
	index='Date',
	columns='Type'])

#### Stack / Unstack

#### Melt

>>> pd.melt(df2,	Gather columns into rows
id_vars=["Date"],	
<pre>value_vars=["Type", "Value"],</pre>	
<pre>value_name="Observations")</pre>	
Date	Variable Observations

	Date	Type	Value			Date	Variable	Observations
П		Турс	_		0	2016-03-01	Туре	a
0	2016-03-01	a	11.432		1	2016-03-02	Type	b
1	2016-03-02	b	13.031		2	2016-03-01	Type	С
2	2016-03-01	с	20.784	_	3	2016-03-03	Type	a
3	2016-03-03	a	99,906		4	2016-03-02	Type	a
4	2016-03-02	a	1.303		5	2016-03-03	Type	С
Ħ					6	2016-03-01	Value	11.432
5	2016-03-03	С	20.784		7	2016-03-02	Value	13.031
					8	2016-03-01	Value	20.784
					9	2016-03-03	Value	99.906
					10	2016-03-02	Value	1.303
					11	2016-03-03	Value	20.784

#### Iteration

>>> df.iteritems()	(Column-index, Series) pairs
>>> df.iterrows()	(Row-index, Series) pairs

## Advanced Indexing

#### Selecting >>> df3.loc[:,(df3>1).any()] >>> df3.loc[:,(df3>1).all()]

>>> df3.loc[:,df3.isnull().any()] >>> df3.loc[:,df3.notnull().all()]

# Indexing With isin

>>> df[(df.Country.isin(df2.Type))] >>> df3.filter(items="a","b"]) >>> df.select(lambda x: not x%5)

#### Where

>>> s.where(s > 0)

#### Query

>>> df6.query('second > first')

### Also see NumPy Arrays

Select cols with any vals >
Select cols with vals > 1
Select cols with NaN
Select cols with NaN Select cols without NaN

Find same elements Filter on values Select specific elements

Subset the data

Query DataFrame

### Setting/Resetting Index

>>> df.set index('Country')	Set the index
>>> df4 = df.reset index()	Reset the index
>>> df = df.rename(index=str,	Rename DataFrame
columns={"Country":"cntry",	
"Capital":"cptl",	
"Population":"ppltn"})	

#### Reindexing

>>> s2 = s.reindex(['a','c','d','e','b'])

#### Forward Filling

#### Backward Filling

>>>	>> df.reindex(range(4),				s3 =	s.reindex(range(5),
		method=	'ffill')			method='bfill')
	Country	Capital	Population	0	3	
0	Belgium	Brussels	11190846	1	3	
1	India	New Delhi	1303171035	2	3	
2	Brazil	Brasília	207847528	3	3	
3	Brazil	Brasília	207847528	4	3	

#### MultiIndexing

```
>>> arrays = [np.array([1,2,3]),
np.array([5,4,3])]
>>> df5 = pd.DataFrame(np.random.rand(3, 2), index=arrays)
>>> tuples = list(zip(*arrays))
>>> index = pd.MultiIndex.from tuples(tuples,
                                         names=['first', 'second'])
>>> df6 = pd.DataFrame(np.random.rand(3, 2), index=index)
>>> df2.set index(["Date", "Type"])
```

# **Duplicate Data**

>>>	s3.unique()	Return unique values
>>>	df2.duplicated('Type')	Check duplicates
>>>	df2.drop duplicates('Type', keep='last')	Drop duplicates
>>>	df.index.duplicated()	Check index duplicates

# **Grouping Data**

# Aggregation

```
>>> df2.groupby(by=['Date','Type']).mean()
>>> df4.groupby(level=0).sum()
>>> df4.groupby(level=0).agg({'a':lambda x:sum(x)/len(x),
                              'b': np.sum})
Transformation
```

>>> customSum = lambda x: (x+x%2) >>> df4.groupby(level=0).transform(customSum)

# Missing Data

>>>	df.dropna()
>>>	df3.fillna(df3.mean())
>>>	df2.replace("a", "f")

#### Drop NaN values Fill NaN values with a predetermined value Replace values with others

### Combining Data

### data1 X2 11.432 1.303 99.906

data2			
X1 X3			
20.784			
NaN			
20.784			

#### Merae

>>>	pd.merge(data1,
	data2,
	how='outer',
	on='X1')

#### X2 X3 11.432 20.784 1.303 NaN NaN 99.906

	X1	X2	2
d.merge(data1, data2,	a	11.432	20
how='outer',	b	1.303	N
on='X1')	С	99.906	N
	d	NaN	20

#### loin

>>> data1.join(data2, how='right')

#### Concatenate

	[	('d'	,1),	('d'	,2),	('e',2)],
		nai	mes=	['n'.	,'v'	1)))

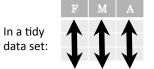

# **Method Chaining**

Create DataFrame with a MultiIndex

Most pandas methods return a DataFrame so that another pandas method can be applied to the result. This improves readability of code.

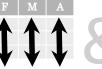

```
df = (pd.melt(df)
        .rename(columns={
                 'variable' : 'var',
                 'value' : 'val'})
         .query('val >= 200')
```

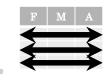

# Tidy Data - A foundation for wrangling in pandas

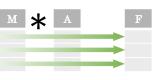

Each variable is saved

in its own column

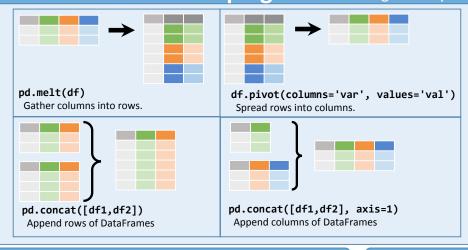

Tidy data complements pandas's vectorized operations. pandas will automatically preserve observations as you manipulate variables. No other format works as intuitively with pandas.

Each observation is saved in its own row

# Reshaping Data – Change the layout of a data set

df.sort values('mpg') Order rows by values of a column (low to high). df.sort values('mpg',ascending=False) Order rows by values of a column (high to low). df.rename(columns = {'v':'year'}) Rename the columns of a DataFrame df.sort\_index() Sort the index of a DataFrame df.reset index() Reset index of DataFrame to row numbers, moving index to columns. df.drop(['Length','Height'], axis=1) Drop columns from DataFrame

# **Subset Observations** (Rows)

df[df.Length > 7] Extract rows that meet logical criteria.

df.drop\_duplicates() Remove duplicate rows (only considers columns).

df.head(n) Select first n rows. df.tail(n)

Select last n rows.

df.sample(frac=0.5) Randomly select fraction of rows. df.sample(n=10)

Randomly select n rows. df.iloc[10:20]

Select rows by position. df.nlargest(n, 'value')

Select and order top n entries.

df.nsmallest(n, 'value') Select and order bottom n entries.

Logic in Python (and pandas) Less than Not equal to Greater than df.column.isin(values) Group membership pd.isnull(*obi*) == Equals Is NaN pd.notnull(*obj*) <= Less than or equals Is not NaN >= Greater than or equals &, |, ~, ^, df.any(), df.all() Logical and, or, not, xor, any, all

# Subset Variables (Columns)

df[['width','length','species']] Select multiple columns with specific names.

df['width'] or df.width

Select single column with specific name.

df.filter(regex='regex')

Select columns whose name matches regular expression regex.

regex (Regular Expressions) Examples		
'\.' Matches strings containing a period '.'		
'Length\$'	Matches strings ending with word 'Length'	
'^Sepal' Matches strings beginning with the word 'Sepal'		
'^x[1-5]\$'	^x[1-5]\$' Matches strings beginning with 'x' and ending with 1,2,3,4,5	
''^(?!Species\$).*'	Matches strings except the string 'Species'	

df.loc[:,'x2':'x4']

Select all columns between x2 and x4 (inclusive).

df.iloc[:,[1,2,5]]

Select columns in positions 1, 2 and 5 (first column is 0).

df.loc[df['a'] > 10, ['a','c']]

Select rows meeting logical condition, and only the specific columns .

http://pandas.pydata.org/ This cheat sheet inspired by Rstudio Data Wrangling Cheatsheet (https://www.rstudio.com/wp -content/uploads/2015/02/data-wrangling-cheatsheet.pdf) Written by Irv Lustig, Princeton Consultants

# **Summarize Data**

df['w'].value counts()

Count number of rows with each unique value of variable len(df)

# of rows in DataFrame.

df['w'].nunique()

# of distinct values in a column.

df.describe()

Basic descriptive statistics for each column (or GroupBy)

pandas provides a large set of summary functions that operate on different kinds of pandas objects (DataFrame columns, Series, GroupBy, Expanding and Rolling (see below)) and produce single values for each of the groups. When applied to a DataFrame, the result is returned as a pandas Series for each column. Examples:

sum()

Sum values of each object.

count() Count non-NA/null values of

each object. median()

Median value of each object.

quantile([0.25,0.75]) Quantiles of each object.

apply(function)

Apply function to each object.

min()

Minimum value in each object.

Maximum value in each object. mean()

Mean value of each object.

var()

Variance of each object.

std()

Standard deviation of each object.

# **Handling Missing Data**

df.dropna()

Drop rows with any column having NA/null data.

df.fillna(value)

Replace all NA/null data with value.

# **Make New Columns**

df.assign(Area=lambda df: df.Length\*df.Height)

Compute and append one or more new columns.

df['Volume'] = df.Length\*df.Height\*df.Depth Add single column.

pd.qcut(df.col, n, labels=False)

Bin column into n buckets.

pandas provides a large set of vector functions that operate on all columns of a DataFrame or a single selected column (a pandas Series). These functions produce vectors of values for each of the columns, or a single Series for the individual Series. Examples:

max(axis=1) Element-wise max. min(axis=1) Element-wise min.

clip(lower=-10,upper=10) abs()

are of the length of the original DataFrame.

Trim values at input thresholds Absolute value. The examples below can also be applied to groups. In this case, the function is applied on a per-group basis, and the returned vectors

# **Group Data**

df.groupby(by="col")

Return a GroupBy object. grouped by values in column named "col".

df.groupby(level="ind")

Return a GroupBy object, grouped by values in index level named "ind".

All of the summary functions listed above can be applied to a group. Additional GroupBy functions:

**Windows** 

size()

Size of each group.

agg(function)

Aggregate group using function.

shift(1)

Copy with values shifted by 1. rank(method='dense')

Ranks with no gaps.

rank(method='min')

Ranks. Ties get min rank.

rank(pct=True)

Ranks rescaled to interval [0, 1].

rank(method='first')

Ranks. Ties go to first value.

shift(-1)

Copy with values lagged by 1.

cumsum()

Cumulative sum.

cummax()

Cumulative max.

cummin()

Cumulative min.

cumprod()

Cumulative product.

# **Plotting**

# df.expanding()

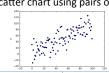

Return an Expanding object allowing summary functions to be applied cumulatively.

# df.rolling(n)

Return a Rolling object allowing summary functions to be applied to windows of length n.

## df.plot.hist() Histogram for each column

df.plot.scatter(x='w',y='h') Scatter chart using pairs of points

# **Combine Data Sets**

adf bdf x1 x3 A 1 A T B 2 C 3 D T

Standard Joins

х3 pd.merge(adf, bdf, 1 T how='left', on='x1') 2 F Join matching rows from bdf to adf. C 3 NaN pd.merge(adf, bdf, A 1.0 T how='right', on='x1') В 2.0 F Join matching rows from adf to bdf. D NaN T

pd.merge(adf, bdf, how='inner', on='x1') Join data. Retain only rows in both sets.

x3 pd.merge(adf, bdf, how='outer', on='x1') 2 Join data. Retain all values, all rows. 3 NaN D NaN T

Filtering Joins

adf[adf.x1.isin(bdf.x1)] All rows in adf that have a match in bdf. A 1 B 2

adf[~adf.x1.isin(bdf.x1)] C 3 All rows in adf that do not have a match in bdf.

> vdf zdf A 1 B 2 C 3 C 3 D 4

**Set-like Operations** 

B 2

C 3

D 4

A 1

x1 x2 pd.merge(vdf, zdf) B 2 Rows that appear in both ydf and zdf C 3 (Intersection). pd.merge(ydf, zdf, how='outer') A 1 Rows that appear in either or both ydf and zdf

(Union).

pd.merge(ydf, zdf, how='outer', indicator=True) .query('\_merge == "left\_only"')

.drop([' merge'],axis=1) Rows that appear in ydf but not zdf (Setdiff).

# Bokeh

Learn Bokeh Interactively at www.DataCamp.com, taught by Bryan Van de Ven, core contributor

# **Plotting With Bokeh**

The Python interactive visualization library Bokeh enables high-performance visual presentation of large datasets in modern web browsers.

Bokeh's mid-level general purpose bokeh.plotting interface is centered around two main components: data and glyphs.

The basic steps to creating plots with the bokeh.plotting interface are:

1. Prepare some data:

Python lists, NumPy arrays, Pandas DataFrames and other sequences of values

- 2. Create a new plot
- 3. Add renderers for your data, with visual customizations
- 4. Specify where to generate the output
- 5. Show or save the results

```
>>> from bokeh.plotting import figure
>>> from bokeh.io import output file, show
>>> x = [1, 2, 3, 4, 5]
>>> y = [6, 7, 2, 4, 5]
>>> p = figure(title="simple line example", < Step 2
              x axis label='x',
              y axis label='y')
>>> p.line(x, y, legend="Temp.", line width=2) < Step 3
>>> output file("lines.html") < Step 4
>>> show(p) Step 5
```

Under the hood, your data is converted to Column Data Sources. You can also do this manually:

```
>>> import numpy as np
>>> import pandas as pd
>>> df = pd.DataFrame(np.array([[33.9,4,65, 'US'],
                                       [32.4,4,66, 'Asia'],
                                       [21.4,4,109, 'Europe']]),
                         columns=['mpg','cyl', 'hp', 'origin'],
index=['Toyota', 'Fiat', 'Volvo'])
```

>>> from bokeh.models import ColumnDataSource >>> cds df = ColumnDataSource(df)

# Plotting

```
>>> from bokeh.plotting import figure
>>> p1 = figure(plot width=300, tools='pan,box zoom')
>>> p2 = figure(plot width=300, plot height=300,
               x_range=(0, 8), y_range=(0, 8))
>>> p3 = figure()
```

# Renderers & Visual Customizations

```
Scatter Markers
>>> p1.circle(np.array([1,2,3]), np.array([3,2,1]),
            fill color='white')
>>> p2.square(np.array([1.5,3.5,5.5]), [1,4,3],
```

color='blue', size=1) Line Glyphs

>>> p1.line([1,2,3,4], [3,4,5,6], line\_width=2) >>> p2.multi line(pd.DataFrame([[1,2,3],[5,6,7]]), pd.DataFrame([[3,4,5],[3,2,1]]), color="blue")

#### **Rows & Columns Lavout**

#### Rows

Columns >>> from bokeh.layouts import row >>> from bokeh.layouts import columns

**Nesting Rows & Columns** 

>>> layout = row(p1,p2,p3) >>> layout = column(p1,p2,p3)

>>>layout = row(column(p1,p2), p3)

## Grid Lavout

```
>>> from bokeh.layouts import gridplot
>>> row1 = [p1,p2]
>>> row2 = [p3]
>>> layout = gridplot([[p1,p2],[p3]])
```

#### Tabbed Layout

```
>>> from bokeh.models.widgets import Panel, Tabs
>>> tab1 = Panel(child=p1, title="tab1")
>>> tab2 = Panel(child=p2, title="tab2")
>>> layout = Tabs(tabs=[tab1, tab2])
```

#### Leaends

#### **Legend Location**

```
Inside Plot Area
```

>>> p.legend.location = 'bottom left'

**Outside Plot Area** 

>> r1 = p2.asterisk(np.array([1,2,3]), np.array([3,2,1]) >>> r2 = p2.line([1,2,3,4], [3,4,5,6]) >>> legend = Legend(items=[("One", [p1, r1]),("Two", [r2])], location=(0, -30)) >>> p.add\_layout(legend, 'right')

# Output

#### **Output to HTML File**

>>> from bokeh.io import output file, show >>> output file('my bar chart.html', mode='cdn')

**Notebook Output** 

>>> from bokeh.io import output notebook, show >>> output notebook()

#### Embedding

#### Standalone HTML

>>> from bokeh.embed import file html

>>> html = file html(p, CDN, "my plot")

Components

>>> from bokeh.embed import components

>>> script, div = components(p)

# **Show or Save Your Plots**

>>> show	(p1)	>>>	save(p1)
>>> show	(layout)	>>>	save(layout)

#### **Customized Glyphs**

#### Selection and Non-Selection Glyphs >>> p = figure(tools='box select')

>>> p.circle('mpg', 'cyl', source=cds df, selection color='red', nonselection alpha=0.1)

# Hover Glyphs

>>> hover = HoverTool(tooltips=None, mode='vline') >>> p3.add tools(hover)

#### Colormapping

```
>>> color_mapper = CategoricalColorMapper(
                      factors=['US', 'Asia', 'Europe'],
                      palette=['blue', 'red', 'green'])
| >>> p3.circle('mpg', 'cyl', source=cds df,
                color=dict (field='origin',
                           transform=color mapper),
```

legend='Origin'))

## Linked Plots Linked Axes

>>> p2.x range = p1.x range >>> p2.y\_range = p1.y\_range

```
Linked Brushing
>>> p4 = figure(plot_width = 100, tools='box_select,lasso_select')
>>> p4.circle('mpg', 'cyl', source=cds_df)
>>> p5 = figure(plot width = 200, tools='box select, lasso select')
>>> p5.circle('mpg', 'hp', source=cds df)
>>> lavout = row(p4,p5)
```

# Legend Orientation

>>> p.legend.orientation = "horizontal" >>> p.legend.orientation = "vertical"

#### Legend Background & Border

>>> p.legend.border line color = "navy" >>> p.legend.background fill color = "white"

# Statistical Charts With Bokeh

Bokeh's high-level bokeh.charts interface is ideal for quickly creating statistical charts

#### Bar Chart

>>> from bokeh.charts import Bar >>> p = Bar(df, stacked=True, palette=['red','blue'])

#### **Box Plot**

| >>> from bokeh.charts import BoxPlot >>> p = BoxPlot(df, values='vals', label='cvl', legend='bottom right')

## Histogram

>>> from bokeh.charts import Histogram >>> p = Histogram(df, title='Histogram')

# Scatter Plot

Matplotlib

Learn Python Interactively at <a href="https://www.DataCamp.com">www.DataCamp.com</a>

## Matplotlib

Matplotlib is a Python 2D plotting library which produces publication-quality figures in a variety of hardcopy formats and interactive environments across matplotlib platforms.

# Prepare The Data

Also see Lists & NumPy

```
>>> import numpy as np
\Rightarrow x = np.linspace(0, 10, 100)
>>> y = np.cos(x)
>>> z = np.sin(x)
```

```
>>> data = 2 * np.random.random((10, 10))
>>> data2 = 3 * np.random.random((10, 10))
>>> Y, X = np.mgrid[-3:3:100j, -3:3:100j]
>>> U = -1 - X**2 + Y
>>> V = 1 + X - Y**2
>>> from matplotlib.cbook import get_sample_data
>>> img = np.load(get sample data('axes grid/bivariate normal.npy'))
```

# Create Plot

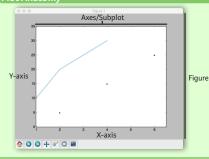

```
>>> import matplotlib.pyplot as plt
```

>>> fig = plt.figure() >>> fig2 = plt.figure(figsize=plt.figaspect(2.0))

All plotting is done with respect to an Axes. In most cases, a subplot will fit your needs. A subplot is an axes on a grid system.

```
>>> fig.add axes()
>>> ax1 = fig.add subplot(221) # row-col-num
>>> ax3 = fig.add subplot(212)
>>> fig3, axes = plt.subplots(nrows=2,ncols=2)
>>> fig4, axes2 = plt.subplots(ncols=3)
```

### Plot Anatomy & Workflow

#### Workflow

The basic steps to creating plots with matplotlib are:

```
1 Prepare data 2 Create plot 3 Plot 4 Customize plot 5 Save plot 6 Show plot
        >>> import matplotlib.pyplot as plt
       >>> x = [1,2,3,4]
       >>> y = [10,20,25,30]
       >>> fig = plt.figure() < Step 2
       >>> ax = fig.add subplot(111) Step 3
       >>> ax.plot(x, y, color='lightblue', linewidth=3) Step 3, 4
       >>> ax.scatter([2,4,6],
                       [5,15,25],
                       color='darkgreen',
                       marker='^')
        >>> ax.set xlim(1, 6.5)
       >>> plt.savefig('foo.png')
       >>> plt.show()
```

# Customize Plot

# Colors, Color Bars & Color Maps

```
>>> plt.plot(x, x, x, x**2, x, x**3)
>>> ax.plot(x, y, alpha = 0.4)
>>> ax.plot(x, y, c='k')
>>> fig.colorbar(im, orientation='horizontal')
>>> im = ax.imshow(img,
                      cmap='seismic')
```

#### Markers

>>> fig, ax = plt.subplots() >>> ax.scatter(x,y,marker=".") >>> ax.plot(x,y,marker="o")

```
>>> plt.plot(x,y,linewidth=4.0)
>>> plt.plot(x,y,ls='solid')
>>> plt.plot(x,y,ls='--')
>>> plt.plot(x,y,'--',x**2,y**2,'-.')
>>> plt.setp(lines,color='r',linewidth=4.0)
```

#### Text & Annotations

```
>>> ax.text(1,
            'Example Graph', style='italic')
>>> ax.annotate("Sine",
                  xy = (8, 0),
                  xycoords='data'
                  xytext = (10.5, 0),
                  textcoords='data
                  arrowprops=dict(arrowstyle="->",
                                connectionstyle="arc3"),)
```

```
>>> plt.title(r'$sigma i=15$', fontsize=20)
```

#### Limits, Legends & Layouts

**Limits & Autoscaling** 

```
>>> ax.margins(x=0.0,v=0.1)
                                                          Add padding to a plot
                                                          Set the aspect ratio of the plot to 1
>>> ax.axis('equal'
>>> ax.set(xlim=[0,10.5],ylim=[-1.5,1.5])
                                                          Set limits for x-and v-axis
>>> ax.set xlim(0,10.5)
                                                          Set limits for x-axis
>>> ax.set(title='An Example Axes',
                                                          Set a title and x-and y-axis labels
            ylabel='Y-Axis',
            xlabel='X-Axis')
>>> ax.legend(loc='best')
                                                          No overlapping plot elements
>>> ax.xaxis.set(ticks=range(1,5),
                                                          Manually set x-ticks
                   ticklabels=[3,100,-12,"foo"])
                                                          Make y-ticks longer and go in and out
>>> ax.tick params(axis='y',
                      direction='inout',
                      length=10)
Subplot Spacing
>>> fig3.subplots adjust(wspace=0.5,
                                                          Adjust the spacing between subplots
                            hspace=0.3,
                            left=0.125,
                            right=0.9,
```

# >>> fig.tight layout()

**Axis Spines** >>> ax1.spines['top'].set visible(False) Fit subplot(s) in to the figure area

#### Make the top axis line for a plot invisible >>> ax1.spines['bottom'].set position(('outward',10)) Move the bottom axis line outward

# **Plotting Routines**

#### 1D Data

```
>>> lines = ax.plot(x,y)
>>> ax.scatter(x,v)
>>> axes[0,0].bar([1,2,3],[3,4,5])
>>> axes[1,0].barh([0.5,1,2.5],[0,1,2])
>>> axes[1,1].axhline(0.45)
>>> axes[0,1].axvline(0.65)
>>> ax.fill(x,y,color='blue')
                                         Draw filled polygons
>>> ax.fill between(x,y,color='yellow')
                                         Fill between y-values and o
```

Draw points with lines or markers connecting them Draw unconnected points, scaled or colored Plot vertical rectangles (constant width) Plot horiontal rectangles (constant height) Draw a horizontal line across axes Draw a vertical line across axes

# **Vector Fields**

>>>		Add an arrow to the axes
>>>	axes[1,1].quiver(y,z)	Plot a 2D field of arrows
>>>	axes[0,1].streamplot(X,Y,U,V)	Plot 2D vector fields

#### Data Distributions

///	axi.Hist(y)
>>>	ax3.boxplot(y)
>>>	ax3.violinplot(z)

Plot a histogram Make a box and whisker plot Make a violin plot

#### 2D Data or Images

```
>>> fig, ax = plt.subplots()
>>> im = ax.imshow(img,
                         cmap='gist earth',
                         interpolation='nearest',
                         vmin=-2.
                         vmax=2)
```

Colormapped or RGB arrays

```
>>> axes2[0].pcolor(data2)
>>> axes2[0].pcolormesh(data)
>>> CS = plt.contour(Y, X, U)
>>> axes2[2].contourf(data1)
>>> axes2[2] = ax.clabel(CS)
```

Pseudocolor plot of 2D array Pseudocolor plot of 2D array Plot contours Plot filled contours Label a contour plot

# Save Plot

top=0.9,

bottom=0.1

#### Save figures >>> plt.savefig('foo.png') Save transparent figures >>> plt.savefig('foo.png', transparent=True)

# Show Plot

>>> plt.show()

#### Close & Clear

>>>	plt.cla()
>>>	plt.clf()
>>>	plt.close()

Clear an axis Clear the entire figure Close a window

# Scikit-Learn

Learn Python for data science Interactively at www.DataCamp.com

### Scikit-learn

Scikit-learn is an open source Python library that implements a range of machine learning, preprocessing, cross-validation and visualization algorithms using a unified interface.

### A Basic Example

```
>>> from sklearn import neighbors, datasets, preprocessing
>>> from sklearn.model selection import train test split
>>> from sklearn.metrics import accuracy score
>>> iris = datasets.load iris()
>>> X, y = iris.data[:, :2], iris.target
>>> X_train, X_test, y_train, y_test = train_test_split(X, y, random_state=33)
>>> scaler = preprocessing.StandardScaler().fit(X train)
>>> X train = scaler.transform(X train)
>>> X test = scaler.transform(X test)
>>> knn = neighbors.KNeighborsClassifier(n neighbors=5)
>>> knn.fit(X train, y train)
>>> y pred = knn.predict(X test)
>>> accuracy_score(y_test, y_pred)
```

# **Loading The Data**

Also see NumPy & Pandas

Your data needs to be numeric and stored as NumPy arrays or SciPy sparse matrices. Other types that are convertible to numeric arrays, such as Pandas DataFrame, are also acceptable.

```
>>> import numpy as np
>>> X = np.random.random((10,5))
```

# **Training And Test Data**

```
>>> from sklearn.model selection import train test split
>>> X_train, X_test, y_train, y_test = train_test_split(X,
                                                  random state=0)
```

# **Create Your Model**

### Supervised Learning Estimators

#### **Linear Regression**

>>> from sklearn.linear model import LinearRegression >>> lr = LinearRegression(normalize=True)

#### Support Vector Machines (SVM)

>>> from sklearn.svm import SVC >>> svc = SVC(kernel='linear')

>>> from sklearn.naive bayes import GaussianNB >>> gnb = GaussianNB()

>>> from sklearn import neighbors >>> knn = neighbors.KNeighborsClassifier(n neighbors=5)

#### Unsupervised Learning Estimators

#### Principal Component Analysis (PCA)

>>> from sklearn.decomposition import PCA >>> pca = PCA(n components=0.95)

#### K Means

>>> from sklearn.cluster import KMeans >>> k means = KMeans(n clusters=3, random state=0)

# **Model Fitting**

### Supervised learning

>>> lr.fit(X, y) >>> knn.fit(X train, y train) >>> svc.fit(X train, y train)

### Unsupervised Learning

>>> k means.fit(X train) >>> pca model = pca.fit transform(X train)

# Fit the model to the data

Fit the model to the data Fit to data, then transform it

#### Prediction

#### **Supervised Estimators**

>> y pred = svc.predict(np.random.random((2,5)) >>> y pred = lr.predict(X test) >>> y pred = knn.predict proba(X test)

# **Unsupervised Estimators**

>> y pred = k means.predict(X test)

Predict labels Predict labels Estimate probability of a label

Predict labels in clustering algos

# **Preprocessing The Data**

#### Standardization

>>> from sklearn.preprocessing import StandardScaler >>> scaler = StandardScaler().fit(X train)

>>> standardized X = scaler.transform(X train)

>>> standardized X test = scaler.transform(X test)

#### Normalization

>>> from sklearn.preprocessing import Normalizer >>> scaler = Normalizer().fit(X train)

>>> normalized X = scaler.transform(X train)
>>> normalized X test = scaler.transform(X test)

#### Binarization

>>> from sklearn.preprocessing import Binarizer >>> binarizer = Binarizer(threshold=0.0).fit(X)

>>> binary X = binarizer.transform(X)

# Encoding Categorical Features

>>> from sklearn.preprocessing import LabelEncoder >>> enc = LabelEncoder()

>>> v = enc.fit transform(v)

#### Imputing Missing Values

>>> from sklearn.preprocessing import Imputer

>>> imp = Imputer(missing values=0, strategy='mean', axis=0)

>>> imp.fit transform(X train)

# **Generating Polynomial Features**

>>> from sklearn.preprocessing import PolynomialFeatures

>>> poly = PolynomialFeatures(5)

>>> poly.fit transform(X)

#### **Evaluate Your Model's Performance**

#### Classification Metrics

#### **Accuracy Score**

>>> knn.score(X test, y test)

Estimator score method

>>> from sklearn.metrics import accuracy score Metricscoring functions >>> accuracy score(y test, y pred)

#### Classification Report

>>> from sklearn.metrics import classification\_report Precision, recall, f1-score >>> print(classification report(y test, y pred)) and support

#### **Confusion Matrix**

>>> from sklearn.metrics import confusion matrix >>> print(confusion matrix(y test, y pred))

### **Regression Metrics**

#### Mean Absolute Error

>>> from sklearn.metrics import mean\_absolute\_error >>> y true = [3, -0.5, 2]

>>> mean absolute\_error(y\_true, y\_pred)

#### Mean Squared Error

>>> from sklearn.metrics import mean\_squared\_error

>>> mean\_squared\_error(y\_test, y\_pred)

#### R<sup>2</sup> Score

>>> from sklearn.metrics import r2 score >>> r2 score(y true, y pred)

### Clustering Metrics

#### Adjusted Rand Index

>>> from sklearn.metrics import adjusted rand score >>> adjusted rand score(y\_true, y\_pred)

#### Homogeneity

>>> from sklearn.metrics import homogeneity score >>> homogeneity score(y true, y pred)

>>> from sklearn.metrics import v measure score

## >>> metrics.v measure score(y\_true, y\_pred)

#### **Cross-Validation**

>>> from sklearn.cross validation import cross val score

>>> print(cross\_val\_score(knn, X\_train, y\_train, cv=4))
>>> print(cross\_val\_score(lr, X, y, cv=2))

# **Tune Your Model**

#### Grid Search

>>> from sklearn.grid search import GridSearchCV >>> grid = GridSearchCV(estimator=knn, param grid=params) >>> grid.fit(X\_train, y\_train) >>> print(grid.best score ) >>> print(grid.best estimator .n neighbors)

### Randomized Parameter Optimization

param\_distributions=params, cv=4, n iter=8, random state=5) >>> rsearch.fit(X train, y train) >>> print(rsearch.best score )

SciPy - Linear Algebra

Learn More Python for Data Science Interactively at www.datacamp.com

# SciPv

The SciPy library is one of the core packages for scientific computing that provides mathematical algorithms and convenience functions built on the NumPy extension of Python.

# Interacting With NumPv

#### Also see NumPv

```
>>> import numpy as np
>>> a = np.array([1,2,3])
>>> b = np.array([(1+5j,2j,3j), (4j,5j,6j)])
>>> c = np.array([[(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]])
```

#### Index Tricks

>>> np.mgrid[0:5,0:5]	Create a dense meshgrid
>>> np.ogrid[0:2,0:2]	Create an open meshgrid
>>> np.r [3,[0]*5,-1:1:10j]	\$tack arrays vertically (row-wise)
>>> np.c [b,c]	Create stacked column-wise arrays

## Shape Manipulation

>>> np.transpose(b) >>> b.flatten()	Permute array dimensions Flatten the array
>>> np.hstack((b,c))	Stack arrays horizontally (column-wise)
>>> np.vstack((a,b))	Stack arrays vertically (row-wise)
>>> np.hsplit(c,2)	Split the array horizontally at the 2nd index
>>> np.vpslit(d,2)	Split the array vertically at the 2nd index

#### Polynomials

>>>	from numpy import polyld	
>>>	p = poly1d([3,4,5])	Create a polynomial object

#### **Vectorizing Functions**

```
>>> def myfunc(a):
         if a < 0:
           return a*2
           return a/2
                                     Vectorize functions
>>> np.vectorize(myfunc)
```

### Type Handling

>>> >>>		Return the real part of the array elements Return the imaginary part of the array elements Return a real array if complex parts close to o Cast object to a data type
>>>	np.cast['f'](np.pi)	Cast object to a data type

#### Other Useful Functions

ı	>>> np.angle(b,deg=True)	Return the angle of the complex argument
ı	>>> g = np.linspace(0,np.pi,num=5)	Create an array of evenly spaced values
ı	>>> g [3:] += np.pi	(number of samples)
ı	>>> np.unwrap(g)	Unwrap
ı	>>> np.logspace(0,10,3)	Create an array of evenly spaced values (log scale)
ı	>>> np.select([c<4],[c*2])	Return values from a list of arrays depending on
ı		conditions
ı	>>> misc.factorial(a)	Factorial
ı	>>> misc.comb(10,3,exact=True)	Combine N things taken at k time
1	>>> misc.central_diff_weights(3)	Weights for Np-point central derivative
1	>>> misc.derivative(myfunc,1.0)	Find the n-th derivative of a function at a point

# Linear Algebra

You'll use the linalg and sparse modules. Note that scipy.linalg contains and expands on numpy.linalg.

>>> from scipy import linalg, sparse

#### Creating Matrices

>>> A = np.matrix(np.random.random((2,2)))
>>> B = np.asmatrix(b)
>>> C = np.mat(np.random.random((10,5)))
>>> D = np.mat([[3,4], [5,6]])

#### **Basic Matrix Routines**

#### Inverse

>>>	A.I	
>>>	linalg.inv	(A)

#### **Transposition** >>> A.T

>	>	>	A	

## Trace

>>> np.trace(A)

#### Norm

>>>	linalg.norm(A)
>>>	linalg.norm(A,1)
>>>	<pre>linalg.norm(A,np.inf)</pre>

#### Rank

>>> np.linalg.matrix rank(C)

# Determinant

>>> linalg.det(A)

# Solving linear problems

///	IIIIaig.Solve(A,D)
>>>	E = np.mat(a).T
>>>	linald lstsd(F.E)

# Generalized inverse

>>>	linalg.pinv	(C

#### >>> linalg.pinv2(C)

# Inverse Inverse

Tranpose matrix Conjugate transposition

# Frobenius norm

L1 norm (max column sum) L inf norm (max row sum)

#### Matrix rank

Determinant

#### Solver for dense matrices Solver for dense matrices

Least-squares solution to linear matrix equation

#### Compute the pseudo-inverse of a matrix (least-squares solver)

Compute the pseudo-inverse of a matrix (SVD)

# Creating Sparse Matrices

	<pre>F = np.eye(3, k=1) G = np.mat(np.identity(2))</pre>	Create a 2X2 identity matrix
	G = np.mat(np.identity(2)) C[C > 0.5] = 0	Create a 2x2 identity matrix
	H = sparse.csr matrix(C)	Compressed Sparse Row matrix
	I = sparse.csc matrix(D)	Compressed Sparse Column matrix
	J = sparse.dok matrix(A)	Dictionary Of Keys matrix
>>>	E.todense()	Sparse matrix to full matrix
>>>	sparse.isspmatrix_csc(A)	Identify sparse matrix

#### Sparse Matrix Routines

#### Inverse >>> sparse.linalg.inv(I)

Norm

#### >>> sparse.linalg.norm(I) Solving linear problems

>> sparse.linalg.spsolve(H,I)

# Norm

Inverse

# Solver for sparse matrices

# Sparse Matrix Functions

>>>	sparse.linalg.expm(I)	Sparse matrix exponential

# Asking For Help

```
>>> help(scipy.linalg.diagsvd)
>> np.info(np.matrix)
```

#### Matrix Functions

#### Addition

>>>	np	.add	(A,	D

#### Subtraction

#### **DataCamp** Learn Python for Data Science Interactively

# Keras

Learn Python for data science Interactively at www.DataCamp.com

#### Keras

Keras is a powerful and easy-to-use deep learning library for Theano and TensorFlow that provides a high-level neural networks API to develop and evaluate deep learning models.

#### A Basic Example

#### Data

#### Also see NumPy, Pandas & Scikit-Learn

Your data needs to be stored as NumPy arrays or as a list of NumPy arrays. Ideally, you split the data in training and test sets, for which you can also resort to the train test split module of sklearn.cross validation.

#### Keras Data Sets

#### Other

```
>>> from urllib.request import urlopen
>>> data = np.loadtxt(urlopen("http://archive.ics.uci.edu/
ml/machine-learning-databases/pima-indians-diabetes/
pima-indians-diabetes.data"),delimiter=",")
>>> X = data[:,0:8]
>>> y = data[:,8]
```

# **Preprocessing**

# Sequence Padding

```
>>> from keras.preprocessing import sequence
```

>>> x\_train4 = sequence.pad\_sequences(x\_train4,maxlen=80)
>>> x\_test4 = sequence.pad\_sequences(x\_test4,maxlen=80)

#### One-Hot Encoding

```
>>> from keras.utils import to_categorical
>>> Y train = to_categorical(y train, num classes)
>>> Y test = to_categorical(y test, num_classes)
>>> Y train3 = to_categorical(y train3, num_classes)
>>> Y test3 = to_categorical(y test3, num_classes)
```

# **Model Architecture**

### Sequential Model

```
>>> from keras.models import Sequential
>>> model = Sequential()
>>> model2 = Sequential()
>>> model3 = Sequential()
```

#### Multilayer Perceptron (MLP)

#### Binary Classification

#### ograccion

>>> model.add(Dense(64,activation='relu',input\_dim=train\_data.shape[1]))
>>> model.add(Dense(1))

#### Convolutional Neural Network (CNN)

```
>>> from keras.layers import Activation, Conv2D, MaxPooling2D, Flatten
>>> model2.add(Conv2D(32,(3,3),padding='same',input shape=x train.shape[1:])
>>> model2.add(Activation('relu'))
>>> mode12.add(Conv2D(32,(3,3)))
>>> model2.add(Activation('relu'))
>>> model2.add(MaxPooling2D(pool size=(2,2)))
>>> model2.add(Dropout(0.25))
>>> model2.add(Conv2D(64,(3,3), padding='same'))
>>> model2.add(Activation('relu'))
>>> model2.add(Conv2D(64,(3, 3)))
>>> model2.add(Activation('relu'))
>>> model2.add(MaxPooling2D(pool_size=(2,2)))
>>> model2.add(Dropout(0.25))
>>> model2.add(Flatten())
>>> model2.add(Dense(512))
>>> model2.add(Activation('relu'))
>>> mode12.add(Dropout(0.5))
>>> mode12.add(Dense(num classes))
>>> model2.add(Activation('softmax'))
```

#### Recurrent Neural Network (RNN)

```
>>> from keras.klayers import Embedding,LSTM
>>> model3.add(Embedding(20000,128))
>>> model3.add(LSTM(128,dropout=0.2,recurrent_dropout=0.2))
>>> model3.add(Dense(1,activation='sigmoid'))
```

#### Also see NumPy & Scikit-Learn

#### **Train and Test Sets**

#### Standardization/Normalization

```
>>> from sklearn.preprocessing import StandardScaler
>>> scaler = StandardScaler().fit(x train2)
>>> standardized X = scaler.transform(x train2)
>>> standardized_X_test = scaler.transform(x_test2)
```

### **Inspect Model**

# **Compile Model**

# **Model Training**

metrics=['accuracy'])

# **Evaluate Your Model's Performance**

>>> model3.compile(loss='binary\_crossentropy', optimizer='adam',

```
>>> score = model3.evaluate(x_test, y_test, batch size=32)
```

#### Prediction

```
>>> model3.predict(x_test4, batch_size=32)
>>> model3.predict classes(x test4,batch_size=32)
```

#### Save/Reload Models

```
>>> from keras.models import load model
>>> model3.save('model file.h5')
>>> my model = load_model('my_model.h5')
```

# **Model Fine-tuning**

#### **Optimization Parameters**

#### Early Stopping

# PySpark Basics

Learn Python for data science Interactively at www.DataCamp.com

# Spark

PySpark is the Spark Python API that exposes the Spark programming model to Python

# Initializing Spark

#### **SparkContext**

```
>>> from pyspark import SparkContext
>>> sc = SparkContext(master = 'local[2]')
```

## Inspect SparkContext

```
>>> sc.version
>>> sc.pythonVer
>>> sc.master
>>> str(sc.sparkHome)
>>> str(sc.sparkUser())
>>> sc.appName
>>> sc.applicationId
>>> sc.defaultParallelism
>>> sc.defaultMinPartitions
```

Retrieve SparkContext version Retrieve Python version Master URL to connect to Path where Spark is installed on worker nodes Retrieve name of the Spark User running SparkContext Return application name Retrieve application ID Return default level of parallelism Default minimum number of partitions for RDDs

### Configuration

```
>>> from pyspark import SparkConf, SparkContext
>>> conf = (SparkConf()
            .setMaster("local")
            .setAppName("My app")
            .set("spark.executor.memory", "1g"))
>>> sc = SparkContext(conf = conf)
```

### Using The Shell

In the PySpark shell, a special interpreter-aware SparkContext is already created in the variable called sc.

```
./bin/spark-shell --master local[2]
./bin/pyspark --master local[4] --py-files code.py
```

Set which master the context connects to with the --master argument, and add Python .zip, .egg or .py files to the runtime path by passing a comma-separated list to --py-files.

# **Loading Data**

#### Parallelized Collections

```
>>> rdd = sc.parallelize([('a',7),('a',2),('b',2)])
>>> rdd2 = sc.parallelize([('a',2),('d',1),('b',1)])
>>> rdd3 = sc.parallelize(range(100))
>>> rdd4 = sc.parallelize([("a",["x","y","z"]), ("b",["p", "r"])])
```

#### **External Data**

Read either one text file from HDFS, a local file system or or any Hadoop-supported file system URI with textFile(), or read in a directory of text files with wholeTextFiles().

```
>>> textFile = sc.textFile("/my/directory/*.txt")
>>> textFile2 = sc.wholeTextFiles("/my/directory/")
```

## **Retrieving RDD Information**

#### **Basic Information**

```
>>> rdd.getNumPartitions()
                                                    List the number of partitions
                                                    Count RDD instances
>>> rdd.count()
>>> rdd.countByKey()
                                                    Count RDD instances by key
defaultdict(<type 'int'>, {'a':2,'b':1})
>>> rdd.countByValue()
                                                    Count RDD instances by value
defaultdict(<type 'int'>, {('b',2):1,('a',2):1,('a',7):1}}
                                                    Return (key,value) pairs as a
>>> rdd.collectAsMap()
{'a': 2,'b': 2}
                                                    dictionary
                                                    Sum of RDD elements
>>> rdd3.sum()
>>> sc.parallelize([]).isEmpty()
                                                    Check whether RDD is empty
```

#### Summary

>>> rdd3.max()	Ma
>>> rdd3.min()	Mir
>>> rdd3.mean() 49.5	Me
>>> rdd3.stdev() 28.866070047722118	Sta
>>> rdd3.variance() 833.25	Cor
>>> rdd3.histogram(3) ([0,33,66,99],[33,33,34])	Cor
>>> rdd3.stats()	Sur

ximum value of RDD elements

nimum value of RDD elements ean value of RDD elements

andard deviation of RDD elements

mpute variance of RDD elements

mpute histogram by bins

mmary statistics (count, mean, stdey, max &

# **Applying Functions**

```
>>> rdd.map(lambda x: x+(x[1],x[0]))
       .collect()
  [('a',7,7,'a'),('a',2,2,'a'),('b',2,2,'b')]
\Rightarrow> rdd5 = rdd.flatMap(lambda x: x+(x[1],x[0]))
 ['a',7,7,'a','a',2,2,'a','b',2,2,'b']
>>> rdd4.flatMapValues(lambda x: x)
        .collect()
  [('a','x'),('a','y'),('a','z'),('b','p'),('b','r')]
```

Apply a function to each RDD element

Apply a function to each RDD element and flatten the result

Apply a flatMap function to each (key,value) pair of rdd4 without changing the keys

# Selecting Data

#### Getting

```
>>> rdd.collect()
  [('a', 7), ('a', 2), ('b', 2)]
>>> rdd.take(2)
[('a', 7), ('a', 2)]
>>> rdd.first()
                                                  Take first RDD element
  ('a', 7)
>>> rdd.top(2)
  [('b', 2), ('a', 7)]
```

>>> rdd3.sample(False, 0.15, 81).collect() Return sampled subset of rdd3 [3,4,27,31,40,41,42,43,60,76,79,80,86,97]

>>> rdd.filter(lambda x: "a" in x) .collect() [('a',7),('a',2)]

>>> rdd5.distinct().collect() ['a',2,'b',7] >>> rdd.keys().collect() ['a', 'a', 'b']

Return a list with all RDD elements

Take first 2 RDD elements

Take top 2 RDD elements

Filter the RDD

Return distinct RDD values

Return (kev.value) RDD's kevs

### Iterating

recruently	
>>> def g(x): print(x) >>> rdd.foreach(g) ('a', 7) ('b', 2) ('a', 2)	Apply a function to all RDD elements

## Reshaping Data

### Reducina

```
>>> rdd.reduceByKey(lambda x,y : x+y)
      .collect()
 [('a',9),('b',2)]
>>> rdd.reduce(lambda a, b: a + b)
 ('a',7,'a',2,'b',2)
```

Merge the rdd values for each key

Return RDD of grouped values

Merge the ridd values

#### Grouping by

>>> rdd3.groupBy(lambda x: x % 2) .mapValues(list) .collect() >>> rdd.groupByKey()

[('a',[7,2]),('b',[2])]

.collect()

.collect()

>>> rdd3.keyBy(lambda x: x+x)

[('a',9),('b',2)]

Group rdd by key .mapValues(list) .collect()

#### Aggregating

```
>>> seqOp = (lambda x, y: (x[0]+y, x[1]+1))
>>> combOp = (lambda x, y:(x[0]+y[0],x[1]+y[1]))
>>> rdd3.aggregate((0,0),segOp,combOp)
 (4950,100)
>>> rdd.aggregateByKey((0,0),seqop,combop)
       .collect()
 [('a',(9,2)), ('b',(2,1))]
>>> rdd3.fold(0,add)
>> rdd.foldByKey(0, add)
```

Aggregate RDD elements of each partition and then the results Aggregate values of each RDD key

Aggregate the elements of each partition, and then the results Merge the values for each key

Create tuples of RDD elements by

applying a function

## **Mathematical Operations**

```
>>> rdd.subtract(rdd2)
                                         Return each rdd value not contained
        .collect()
                                        in rdd2
 [('b',2),('a',7)]
>>> rdd2.subtractByKey(rdd)
                                         Return each (key,value) pair of rdd2
         .collect()
                                        with no matching key in rdd
 [('d', 1)]
>>> rdd.cartesian(rdd2).collect()
                                        Return the Cartesian product of rdd
                                        and rdd2
```

#### Sort

```
>>> rdd2.sortBy(lambda x: x[1])
                                          Sort RDD by given function
         .collect()
  [('d',1),('b',1),('a',2)]
>>> rdd2.sortByKey()
                                          Sort (key, value) RDD by key
         .collect()
  [('a',2),('b',1),('d',1)]
```

# Repartitioning

>>> rdd.repartition(4) >>> rdd.coalesce(1)  New RDD with 4 partitions Decrease the number of partitions	tions in the RDD to 1
---	-----------------------

## Saving

```
>>> rdd.saveAsTextFile("rdd.txt")
>>> rdd.saveAsHadoopFile("hdfs://namenodehost/parent/child"
                           'org.apache.hadoop.mapred.TextOutputFormat'
```

# Stopping SparkContext

>>> sc.stop()

#### Execution

\$ ./bin/spark-submit examples/src/main/python/pi.py

# A mostly complete chart of
